

TalentFlow ATS

Where the build stands today. Shown live, with honest status on each part, and the open questions where we need your input.

Format: about 15 minutes, then questions • **For:** HR, Project and Product leads • **From:** the development team

PRESENTING

- D Danish · project lead.** Frames each part and gives the honest status.
- S Sanjay · engineering.** Explains how it works and what is solid versus rough.
- P Preethi · product / HR-facing.** Connects it to how your teams actually work, and collects your input.

DONE working today **IN PROGRESS** built, being finished **NEXT** planned, not started yet

Who drives the screen rotates so one of us is always demoing live. Each part starts with an **OPERATOR** box: the exact clicks, using the app's real labels.

Demo login: / • **Sidebar groups:** Hiring, Intelligence, Governance, Workspace.

0 Opening: what this walkthrough is

0:00 – 1:30

ON SCREEN

1. Dashboard ready on a screen-share. Nobody clicks anything until Danish hands over to Preethi.

- Danish** "Thanks for making the time. This is our first full walkthrough of what we have built so far. The plan for the next fifteen minutes is simple. We will show you the main flow working live, a candidate coming in, the resume getting read, screening, the interview, and the admin side. We will be honest about what is done and what is still in progress, and there are a few points where we genuinely need your input. Please stop us with questions at any time."
- Preethi** "And since your teams are the ones who will actually use this every day, your feedback today matters more than anything we say. If something does not match how hiring really works on your side, please tell us. That is exactly what we want from this session."
- Sanjay** "One quick note on how we built it. We wired the real flow end to end, real services and real AI calls, not slides or mock screens. So what you are seeing is the actual system. Some parts are solid, some are still rough, and we will point those out honestly as we go."
- Danish** "Preethi, let us start by signing in."

1 The goals we are building against

1:30 – 2:45

OPERATOR · PREETHI

1. On the login page, type the email in the **Work email** box and the password in the **Password** box.
2. Click the **Sign In** button (it reads "Sign In to" your workspace). It lands on **Home**.

- Sanjay** "While Preethi signs in, here are the four goals we set at the start, so you can hold us to them. One, actually read every applicant, not just the first few. Two, make the AI explain itself, so every score comes with a reason. Three, keep hiring fair, and be able to show that it is. And four, let your team change forms and settings themselves, without raising a ticket with us each time."
- Danish** "So as we go, please measure us against those four. We will show you where we have met them, and we will be clear about where there is still work left to do."

2 How candidates come in

2:45 – 4:30

OPERATOR · PREETHI

EDIT THE APPLICATION FORM

1. Click **Requisitions** in the sidebar, then open any job.
2. Click the **Application form** tab.
3. Under **Add a field**, click **Dropdown**. Type two or three choices, then turn on **Required**.
4. Under **Add a field**, click **File upload**. Set **Accepted types** to **.pdf**.
5. Click **Publish** (top right). Wait for the green **Saved**.

SHOW BULK RESUME UPLOAD

1. Click **Candidates**, then the **Import** button (opens the **Bulk import candidates** page).
2. Choose **Resume files**, click **Choose files**, and pick a folder of resumes.
3. Click **Upload [N] resumes**. Wait for the "resumes uploaded" message.

Preethi "First, how people apply. We built the application form so your team can change it yourselves. I will add a dropdown question, mark it required, and add a field that accepts only PDFs, then click Publish. The public page candidates see updates straight away. No developer needed for a change like this."

Sanjay "There are nine field types, and the basics, name, email and resume, are locked so they cannot be removed by mistake. Candidates can reach you four ways: a public link with no login, a single resume upload, a bulk upload, and a spreadsheet import that checks for duplicates first."

Preethi "Here is the bulk one. I pick a whole folder of resumes and upload them together, and it takes all of them in for reading."

Danish "Status on this part: the form builder and all four ways in are working today."

STATUS **DONE** Form builder and all four intake paths are working today.

3 Reading the resume, and tracking the cost

4:30 – 7:00

OPERATOR · SANJAY

1. Click **Candidates**, then click one candidate to open their profile.
2. Scroll to the **Parsed résumé** section (it has an AI icon, with Fields and Skills).
3. Click **Billing & Plan** in the sidebar. Point to the **AI spend trend** chart.

Sanjay "Once a resume comes in, the AI reads it and fills in the profile. Here is one, the name, contact details, years of experience, skills, and the work history, all pulled out automatically. Each field also gets a confidence score, and it flags anything that looks off, so the recruiter knows where to ask a follow-up question."

Danish "On cost, since that usually comes up early. We track every AI call, so we can tell you what the system actually costs to run. This chart is the month's AI spend by provider. Two honest notes here. First, the chart is in US dollars right now, we still need to switch the display to rupees. Second, we do not have a per-resume cost figure on screen yet. We work it out from the total, which comes to roughly two rupees a resume. If a per-resume view would be useful to you, it is a small addition."

Preethi "From the HR side, the simple value is that the recruiter opens a profile that is already read and organised, instead of a stack of raw PDFs to wade through."

STATUS **DONE** Resume reading and cost tracking work. **IN PROGRESS** currency display (dollars to rupees).
NEXT optional per-resume cost view, if you want it.

4 Scoring, with the reason shown

7:00 – 9:30

OPERATOR · DANISH

1. Click **Screening** in the sidebar. Click the top candidate to open their scorecard.
2. Expand the requirement list, then turn on the **Reasoning trace** toggle.
3. Click **Review Queue** in the sidebar (under Intelligence) to show flagged candidates.
4. Click **Compliance** (under Governance), then open the **Adverse impact** tab.

Danish "Next, screening. Each candidate is scored against the specific job, with a clear result: pass, review, or fail. We also focused on the reason behind each score. For every requirement, it shows met or not met, and the exact line from the resume that backs it up. So every decision can be explained and audited if needed."

Sanjay "Under the hood, it reads each requirement and looks for real evidence, rather than just matching keywords, and it keeps the bar steady across candidates for the same role. When it is not confident, it does not decide on its own. It sends the candidate to a review queue for a person to look at."

Preethi "And here is that review queue, where a person makes the final call. The screen is clear that the AI only advises. We have also built a fairness view that checks for adverse impact against the standard rule. One honest note: the scoring and the evidence are working, but some of the numbers on this fairness screen are still sample data while we finish connecting the real figures."

STATUS **DONE** scoring, per-requirement evidence, and the human review queue. **IN PROGRESS** the fairness dashboard (partly sample data for now).

5 Setting up the interview

9:30 – 10:45

OPERATOR · PREETHI

1. Click **Interviews** in the sidebar, then click **Schedule interview** (top right).
2. Pick the **Candidate**, pick the **Requisition**, then pick the **Round** (it loads from the job's interview loop).
3. Set the **Date & time** and the **Duration**, then click **Schedule**.

- Preethi** "When a candidate passes, we set up the interview here. I pick the candidate and the job, it already knows the job's interview rounds so I just choose one, I set a time, and click Schedule. It creates a real interview that the panel can see."
- Sanjay** "Two things to be clear about. Creating and tracking interviews works today. The smarter part, where the system reads everyone's calendar and picks a conflict-free time by itself, is designed but needs us to connect Google or Outlook calendars first. That is on our next list, not done yet."
- Danish** "So this area is partly there. Scheduling works now, automatic calendar booking is a next step."

STATUS **DONE** creating and tracking interviews. **NEXT** calendar integration so it can pick times automatically.

6 Access levels and keeping data separate

10:45 – 12:15

OPERATOR · SANJAY

1. Click **Settings** in the sidebar, then open **Team & roles**.
2. Show the people list with their **roles** and the **Reports to** column.
3. Point to the **Invite member** button (no need to actually send one).

- Sanjay** "On access and data safety. There are three levels: a platform admin over the whole system, the company admin, which is your side, and the team beneath that, managers, recruiters, interviewers. A manager can add their own people but cannot give anyone more access than they have themselves. You can see who reports to whom right here. And on keeping companies separate: one company's data cannot be seen by another. That is enforced at the database level, not just in our application code, and it fails safe. This is in place across our services."
- Danish** "Passwords are properly secured, and two-step login and single sign-on are supported."
- Preethi** "And for HR specifically, a hiring manager can grow their own team without waiting on a ticket, and everyone only sees the people they actually manage."

STATUS **DONE** three access levels, database-level data separation, and secure login.

7 Cost control and plans

12:15 – 13:15

OPERATOR · DANISH

1. Click **Billing & Plan** in the sidebar (under Workspace).
2. Show **Usage this period: Agent runs, Tokens in, Tokens out**.
3. Click **Change plan** to open the options, then close the window.

Danish "Quickly on cost control. The idea is that you pay for what is used, not per person on the team. Here is usage and spend for the month. Plans have limits, and if you reach one you get a clear message rather than a surprise bill. We can switch an expensive feature off, and set a monthly cap. The usage and limits work today. The plan-change request flow is wired but still a little rough, and we are polishing it."

Preethi "The point for you is that the cost tracks how much hiring you actually do, rather than how big your team is."

STATUS **DONE** usage, spend, and plan limits. **IN PROGRESS** the plan-change request flow (being polished).

8 Records and data handling

13:15 – 14:00

OPERATOR • DANISH

1. Click **Compliance**, then open the **Audit log** tab to show the timeline.
2. Click **Settings**, then **Data retention**. Point to **Honor erasure requests** and **Purge now**.

Preethi "Last part, records and data handling. Every important action is written to an audit log you cannot edit, only add to. And in settings, you set how long to keep data and switch on automatic handling of erasure requests. One honest point here: a single 'export everything for this candidate' button is not in the screen yet, that currently runs in the back end. We can add a button if your team would use it, and that is a good example of where your input helps us decide what to build next."

STATUS **DONE** audit log and data-retention settings. **NEXT** per-candidate export and erase buttons in the UI, if wanted.

Where we are, and what we need from you

14:00 – 15:00

OPERATOR • DANISH

1. Return to a clean **Home** dashboard so the screen is tidy for questions.

Danish "So that is where we are. The core flow, apply, read, screen, interview, and the admin side, works end to end today. The main things still in progress are connecting the real fairness numbers, the calendar integration for interviews, and a few smaller polish items we flagged along the way."

Preethi "What would help us most now is your steer. A few questions for you. Of the things still in progress, which matters most to your teams? Are there fields or steps in the hiring flow that we have missed? And how would you like fairness and data-deletion handled, so it fits your own policies?"

Sanjay "We will take your feedback into the next round and come back with these gaps closed and a tighter, more finished build."

Danish "Thank you. We are happy to go deeper on any part, or take your questions now."

Status at a glance

A one-look summary you can leave with the team.

AREA	STATUS
Application form builder + four intake paths	DONE working today
AI resume reading (parsing) and cost tracking	DONE working IN PROGRESS currency display, optional per-resume cost
Screening: score + per-requirement evidence + review queue	DONE working today
Fairness / adverse-impact dashboard	IN PROGRESS some sample data, real figures being wired
Interview scheduling and tracking	DONE working NEXT automatic calendar booking
Three access levels + database data separation + secure login	DONE working today
Billing: usage, spend, plan limits, cost cap	DONE working IN PROGRESS plan-change flow polish
Audit log + data-retention settings	DONE working NEXT per-candidate export/erase buttons

Open questions for you

What we would like your input on before the next round.

- 1 Of the in-progress items, fairness data, calendar integration, plan-change polish, which is the highest priority for your teams?
- 2 Are there application-form fields or hiring-pipeline steps your teams need that we have not built yet?
- 3 How would you like fairness monitoring surfaced, and who should see it?
- 4 For data deletion, do you want per-candidate export and erase buttons in the screen, or is the automatic retention handling enough?
- 5 Is a per-resume cost view worth building, or is the monthly total sufficient?

A note on how we have framed status. Everything shown is the live system, not a mock-up. We have marked each area Done, In progress, or Next, and we have called out the specific gaps in plain terms: the billing figures display in dollars and need switching to rupees, the fairness screen still shows some sample data, automatic calendar-based scheduling needs a calendar connected, and per-candidate data export and erase currently run in the back end rather than as buttons. We would rather be clear about these now than oversell them.
